

AWC and Cross Site Scripting

Mitel was recently informed of a cross site scripting vulnerability in AWC. After some research, it was determined that the risk from this vulnerability is low, and it can be minimized by following the actions mentioned below:

1. Users with accounts on the server should be advised to directly go to the web page to login, and not use a link received through e-mail or any other source.
2. Users receiving a conference invitation should also go to the server's web page directly and then enter the conference information to join the conference.

Mitel will be working internally to fix the vulnerability in an upcoming release.

You can find more information about Cross Site Scripting at:
