# 1 Introduction

## 1.1 General Remarks

Information and communication and their seamless integration in "Unified Communications and Collaboration" (UCC) are important, valuable assets forming the core parts of an enterprise business. These assets require every enterprise provide specific levels of protection, depending on individual requirements to availability, confidentiality, integrity and compliance for the communication system and IT infrastructure it utilizes.

Unify attempts to provide a common standard of features and settings of security parameters within delivered products. Beyond this, we generally recommend:

- to adapt these default settings to the needs of the individual customer and the specific characteristic of the solution to be deployed
- to weigh the costs of implementing security measures against the risks of omitting a security measure and to "harden" the systems appropriately.

Product Security Checklists are published as a basis to support the customer and service department in both direct and indirect channels, as well as self-maintainers, to document security setting agreements and discussions.

The Security Checklists can be used for two purposes:

1. **In the planning and design phase** of a particular customer project:  
Use the Product Security Checklists of every relevant product to evaluate, if all products that make part of the solution can be aligned with the customer's security requirements – and document in the Checklist, how they can be aligned. The Product Security Checklist containing customer alignments can be identified as Customer specific Product Security Checklist.  
This ensures that security measures are appropriately considered and included in the Statement of Work to build the basis for the agreement between Unify and the customer: who will be responsible for the individual security measures:
  - During installation/setup of the solution
  - During operation
2. **During installation and during major enhancements or software upgrade activities:**  
The Customer specific Product Security Checklists are used by a technician to apply and/or control the security settings of every individual product.

Figure 1: Usage of Security Checklists (SCL)

### Update and Feedback

- By their nature, security-relevant topics are prone to continuous changes and updates. New findings, corrections and enhancements of this checklist are being included as soon as possible.  
Therefore, we recommend always using the latest version of the Security Checklists of the products that are part of your solution.
- We encourage you to provide feedback in any cases of unclarity, or problems with the application of this checklist.  
Please contact the OpenScape Baseline Security Office ([obso@unify.com](mailto:obso@unify.com)).

## 1.2 Security Strategy for Unify Products

Reliability and security is a key requirement for all products, services and solutions delivered by Unify. This requirement is supported by a comprehensive security software development lifecycle that applies to all new products or product versions being developed from design phase until end of life of the product

Products of Unify are developed according to the Baseline Security Policy, which contains the technical guidelines for the secure development, release and sustaining of the company's products. It defines the fundamental measures for software security that are taken throughout the whole lifecycle of a product, from design phase until end of life:

### Product planning and design:

Threat and Risk analysis (Theoretical Security Assessment) to determine the essential security requirements for the product.

### Product development and test:

Penetration Tests (Practical Security Assessment) to discover implementation vulnerabilities and to verify the hardening of the default system configuration.

**Installation and start of operation:**

Hardening Guides (Security Checklist) to support the secure configuration of the product according to the individual customer's security policy.

**Operation and maintenance:**

Proactive Vulnerability Management to identify, analyze and resolve security vulnerabilities that emerge after products have been released, and to deliver guidance to customers how to mitigate or close these vulnerabilities.

Figure 2: Unify Baseline Security Policy - from Design to EOL

For more information about the Unify product security strategy we refer to the relevant Security Policies [3], [4], [5].

As we at Unify define a secure product, our products are not secure, but - they can be installed, operated, and maintained in a secure way. The level of the products security should be scheduled by the customer.

The necessary information for that is drawn up in the Product Security Checklist. For OpenScape Xpert SM the Product Security Checklist is this document.

## 1.3 History of Change

| Issue | Date    | Summary                                        |
|-------|---------|------------------------------------------------|
| 1     | 04/2023 | First issue of the guide.                      |
| 2     | 05/2024 | Remove Center of Internet Security references. |

## 1.4 Customer Deployment – Overview

This Security Checklist covers the product and lists their security relevant topics and settings in a comprehensive form.

|                                                                                | Customer              | Supplier |
|--------------------------------------------------------------------------------|-----------------------|----------|
| Company                                                                        |                       |          |
| Name                                                                           |                       |          |
| Address                                                                        |                       |          |
| Telephone                                                                      |                       |          |
| E-Mail                                                                         |                       |          |
| Covered Systems<br>(e.g. System, SW version,<br>devices, MAC/IP-<br>addresses) |                       |          |
| Referenced Master<br>Security Checklist                                        | Version:<br><br>Date: |          |
| General Remarks                                                                |                       |          |
| Open Issues<br>to be solved until                                              |                       |          |
| Date                                                                           |                       |          |

## 2 Hardening Procedures in General

### 2.1 OSX Hardening

#### 2.1.1 Disable Master password

Master password is sent to OSX clients with the configuration; therefore, its storage is not considered to be secure.

|                             |                                                             |
|-----------------------------|-------------------------------------------------------------|
| <b>CL-DISABLE-MPWD</b>      | Disable Master password in SM                               |
| Measures                    | Master password should be disabled in the Management Portal |
| References                  | OpenScape Xpert Admin Help                                  |
| Needed Access Rights        | SM Administrator                                            |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>  |
| Customer Comments / Reasons |                                                             |

#### 2.1.2 Configure Call memory password

Call memory entries are part of the profile; therefore, it is protected by the profile credentials. Call memory password is just an additional layer: it protects accessing the Call memory entries on an unattended (but logged-in) profile.

Note: Call memory password is delivered with the profile to the client, its handling is not considered to be secure against high skilled hackers. The profile password protects the profile including the Call memory. Therefore, it is always recommended to log out or switch to Receive Calls Only mode when leaving the OSX client unattended.

|                             |                                                            |
|-----------------------------|------------------------------------------------------------|
| <b>CL- CALLMEMPWD</b>       | Enable Call memory password in SM                          |
| Measures                    | Call memory should be enabled in the Management Portal     |
| References                  | OpenScape Xpert Admin Help                                 |
| Needed Access Rights        | SM Administrator                                           |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                            |

## 2.1.3 Use LDAP authentication for profiles

You can protect the profiles with a password that is stored (hashed) in the database. The option of assigning the profiles to LDAP users is also available; in this case the user credentials are stored wherever the LDAP server stores it (In a Windows environment typically, this place is the Active Directory). Because in this case the storage is out of the database, and often secured by the OS, it is considered more secure against some attacks. To make the LDAP traffic is encrypted, **configure LDAPS** as well.

|                             |                                                                        |
|-----------------------------|------------------------------------------------------------------------|
| <b>CL-LDAP-PROF</b>         | Configure LDAP authentication for the profiles                         |
| Measures                    | Profile logins should be authenticated by the LDAP server using LDAPS. |
| References                  | OpenScape Xpert Admin Help                                             |
| Needed Access Rights        | SM Administrator                                                       |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>             |
| Customer Comments / Reasons |                                                                        |

## 2.1.4 Change HTEMS certificates

Deploy HTEMS certificate according to the Service Manual to encrypt the traffic between SM, TT and MLC.

|                             |                                                                              |
|-----------------------------|------------------------------------------------------------------------------|
| <b>CL-HTEMS-CERT</b>        | Deploy certificates for HTEMS                                                |
| Measures                    | Certificates are signed by organisation CA and deployed on SM, TTs and MLCs. |
| References                  | OpenScape Xpert Admin Help                                                   |
| Needed Access Rights        | SM Administrator                                                             |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                   |
| Customer Comments / Reasons |                                                                              |

## 2.1.5 Disable SHA1 signed certificate support

On OSXMP in System Properties/ Security tab the Accept SHA1 Algorithm for Certificate Signatures checkbox must be unchecked.

|                         |                                                                                               |
|-------------------------|-----------------------------------------------------------------------------------------------|
| <b>CL- DISABLE-SHA1</b> | Disable SHA1 support                                                                          |
| Measures                | System Properties / Security tab / Accept SHA1 Algorithm for Certificate Signatures unchecked |
| References              | OpenScape Xpert Admin Help                                                                    |
| Needed Access Rights    | SM Administrator                                                                              |
| Configured              | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                                    |

|                             |  |
|-----------------------------|--|
| Customer Comments / Reasons |  |
|-----------------------------|--|

## 2.1.6 Configure OCSP validation for certificates

## 2.1.7 Enable/Disable unused interfaces on OSX Clients

If your setup does not absolutely require CTI, you should disable it. Same applies for the Thrift-based API, but here you have the option to enable TLS for it.

## 2.1.8 Harden OSX Client API interface

If the Thrift-based API of the OSX Client is enabled, it must be used with TLS. Therefore, on OSXMP in OSX Client properties, on the Interfaces tab at Thrift-based API group the Use TLS checkbox must be checked.

|                             |                                                            |
|-----------------------------|------------------------------------------------------------|
| <b>CL-OSXCLIENT-API</b>     | Check Use TLS on Interfaces tab of OSX Client properties   |
| Measures                    | Use TLS is checked                                         |
| References                  | OpenScape Xpert Admin Manual                               |
| Needed Access Rights        | SM Administrator                                           |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                            |

Additionally, make sure to change deploy certificates as they are described in the Service Manual.

## 2.1.9 Configure Xpert Internal Communications Media Encryption

The voice data between OSX clients and MLC must be encrypted. Ensure the checkbox for Media Encryption (SRTP) is checked.

|                             |                                                                                                             |
|-----------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>CL-INT-MEDIA-ENCRYPT</b> | Enable media encryption (SRTP)                                                                              |
| Measures                    | OSXMP / System Properties / Security tab / Internal Communication Setting / Media Encryption (SRTP) checked |

## 2.1.10 Configure MLCs to use TLS for SIP

When the SIP proxy/registrar support it, enable TLS for SIP communication.

|                             |                                                                                  |
|-----------------------------|----------------------------------------------------------------------------------|
| <b>CL-SIP-TLS</b>           | Use TLS as SIP transport protocol                                                |
| Measures                    | OSXMP / MLC / Connectivity / SIP Settings / SIP Transport Protocol is set to TLS |
| References                  | OpenScape Xpert Service Manual                                                   |
| Needed Access Rights        | SM Administrator                                                                 |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                       |
| Customer Comments / Reasons |                                                                                  |

## 2.1.11 Enable full certificate check for SIP

TLS only provides real security if the certificates are valid. Enable full certificate validation for SIP connections in OSXMP.

|                             |                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------|
| <b>CL-SIP-CERTCHECK</b>     | Enable full certificate check for SIP TLS connections                                       |
| Measures                    | OSXMP / System Properties / Security tab / SIP Settings / TLS Authentication is set to FULL |
| References                  | OpenScape Xpert Service Manual                                                              |
| Needed Access Rights        | SM Administrator                                                                            |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                                  |
| Customer Comments / Reasons |                                                                                             |

## 2.1.12 Configure MLCs to use SRTP for Media Encryption

Unless a communication endpoint does not support it, enable SRTP for Media Encryption.

|                             |                                                                             |
|-----------------------------|-----------------------------------------------------------------------------|
| <b>CL-MLC-SRTP</b>          | Use SRTP for voice data                                                     |
| Measures                    | OSXMP / MLC / Connectivity / SIP Settings / Media Encryption is set to SRTP |
| References                  | OpenScape Xpert Service Manual                                              |
| Needed Access Rights        | SM Administrator                                                            |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                  |
| Customer Comments / Reasons |                                                                             |

### 2.1.13 Configure Voice Recording to use secure communication

When Siprec is used for Voice recording ensure that secure communication channels are both set for SIP transport protocol (TLS) and Media Encryption (SRTP). This must be done on System Properties and in all Locations.

|                             |                                                                                                                                                                          |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CL-SIPREC-ENCRYPT</b>    | Use TLS for SIP Transport protocol and enable media encryption                                                                                                           |
| Measures                    | System Properties (Location) / Voice Recoding / SIP transport protocol is set to TLS and System Properties (Location) / Voice Recoding / Media Encryption is set to SRTP |

| Needed Access Rights        | SM Administrator                                                                      |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                            |
| Customer Comments / Reasons |                                                                                       |

# 3 System Manager Server Hardening

## 3.1 OSX System Manager Hardening

Each Windows server the OSX System Manager runs on shall be hardened. That may be more than one server in case of using the cluster feature of OSX.

Note: The cluster feature supports maximum 7 System Manager hosts in the OSX software version.

### 3.1.1 OS Hardening

Following OS is approved for the OpenScape Xpert System Manager server:

- Windows Server 2016 (64 bit)
- Windows Server 2019 (64 bit)

If the OS is not delivered by Unify, the hardening of the OS is up to the customer.

#### 3.1.1.1 Updating SM OS with WSUS

The Windows 2016/2019 Standard Server 64 bit for SM can be updated via a WSUS server configured on the System Manager. For more information about WSUS in OSX environment please refer to the official OSX WSUS installation guide and the official WSUS site (see in References).

| CL-SW status WSUS           | SW update executed                                                                                                                                                                                                                                                      |

| Customer Comments / Reasons |                                                                                                                                                                                                                                                                         |

### 3.1.1.2 NLA for Remote Desktop

Turn on Network Level Authentication for Remote Desktops (or disable the Remote Desktop). This can be enabled in the group policy:

Network Level Authentication completes user authentication before you establish a remote desktop connection and the logon screen appears. This is a more secure authentication method that can help protect the remote computer from malicious users and malicious software.

| CL-Windows NLA4RDP          | NLA is required                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### 3.1.1.3 SSL/TLS protocols and ciphers

MS supports a lot of SSL/TLS protocols and ciphers, several of them are outdated. These protocols are used in several Microsoft software such as Remote Desktop or IIS. Disable all the out-of-date protocols, such as:

- every SSL/TLS protocol before TLS 1.1
- RC4 ciphers
- any 64-bit block ciphers

You can disable them in the registry, but the easiest way of disabling them is using the free IIS Crypto GUI application from Nartac Software:

| CL-Windows TLS Ciphers | Old TLS protocols & ciphers are disabled |
|------------------------|------------------------------------------|
|                        |                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Measures                    | Disable the above out-of-date TLS protocols and ciphers either through the registry or with the IIS Crypto GUI                                                                                                                                                                                                                                                                                             |

### 3.1.1.4 IP forwarding

IP Forwarding should be disabled on all SM hosts running Windows. By default, it is set to 0.

An attacker may use this flaw to route packets through this host and potentially bypass some firewalls/ routers/ NAC filtering.

Unless the remote host is a router, it is recommended that you disable IP forwarding.

### 3.1.1.5 MS SQL Server uninstall on Windows Server

Sometimes Microsoft SQL server is preinstalled on Windows Servers. In that case the SQL Server must be uninstalled on all SM hosts.

|                                 |                                                    |                              |
|---------------------------------|----------------------------------------------------|------------------------------|
| <b>CL-Windows SQL uninstall</b> | CL-Windows SQL uninstall                           |                              |
| Measures                        | The SQL Server must be uninstalled on all SM hosts |                              |

| Customer Comments / Reasons |                               |                              |

## 3.1.2 SM Installation hardening

### 3.1.2.1 Configuration HTTPS

Configure HTTPS (HTTP-Secure) according to the Service Manual to encrypt the traffic between the Wildfly server and the browser. Change the default self-signed certificate in https.keystore with the trusted CA signed certificate.

|                             |                                                                               |                              |
|-----------------------------|-------------------------------------------------------------------------------|------------------------------|
| CL-HTTPS                    | Change self-signed certificates                                               |                              |
| Measures                    | The certificates in https.keystore is not the default installed certificates. |                              |

| Needed Access Rights        | Administrator                                                                 |                              |
| SM1 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM2 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM3 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM4 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM5 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM6 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| SM7 (SMID ):                | Yes: <input type="checkbox"/>                                                 | No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                                               |                              |

### 3.1.2.2 Use LDAPS authentication for OSXMP

The built-in Administrator account serves only for demonstration/marketing purposes, its credentials are not stored in a secure way and its password cannot be changed. Therefore, it must be disabled, and LDAP authentication must be configured as described in the Service Manual. LDAPS (Ldap - Secure) is highly recommended, since LDAP itself is a clear text protocol, and passwords are passed through it.

|                      |                                                                                                                                                                                           |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CL-LDAP-MP</b>    | Configure LDAPS authentication for MP                                                                                                                                                     |
| Measures             | Login trials with the Administrator account should fail. Login with the configured LDAPS account should succeed. The LDAPS traffic between OSXMP and the LDAP server should be encrypted. |
| References           | OpenScape Xpert Service Manual                                                                                                                                                            |
| Needed Access Rights | Administrator                                                                                                                                                                             |

|                             |                               |                              |

| SM6 (SMID ):                | Yes: <input type="checkbox"/>                                  | No: <input type="checkbox"/> |
| SM7 (SMID ):                | Yes: <input type="checkbox"/>                                  | No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                                |                              |

## 4 MLC Server Hardening

### 4.1 OSX MLC Server Hardening

Each server the OpenScape Xpert - MLC runs on shall be hardened. That may be more than one server for distributed deployment of OpenScape Xpert – MLC and if so, the modifications should be applied on all servers.

General requirements for all PCs:

- The operating system version is released for the communication software (see sales information)
- Current security updates are installed (see chapter Hardening Procedures in General).

#### 4.1.1 OS Hardening

The Multiline-Controller (MLC) should be installed on Debian 9 "Stretch" or on Debian 11 "Bullseye". In case of new installation, Debian 11 is hardly recommended. Install only the packages that are necessary for the MLC. Do not install any unnecessary software.

#### 4.1.2 OS Update

The operating system should always be updated with the latest security updates.

The updates could be installed from the official Debian security repositories, for further information see <http://www.debian.org/security/>.

|                             |                                                            |
|-----------------------------|------------------------------------------------------------|
| <b>CL-MLC OS updates</b>    | OS updates are installed                                   |
| Measures                    | all security updates are installed on MLC                  |
| Needed Access Rights        | root                                                       |
| References                  | Debian security pages                                      |
| Executed                    | Yes: <input type="checkbox"/> No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                            |

#### 4.1.3 MLC hardening script

Run the prepared MLC hardening script (*/var/mlc/mlc.os.hardening.sh*). It disables the login with root accounts through ssh and sets up the following password policies:

- The password cannot contain the username or the reverse of the username
- The user can try to enter a password 3 times
- The minimum length of a password is 14 characters
- The number of characters that need to be different from the old password is 2
- At least 1 digit must be present in a password
- At least 1 other than digit character must be present in a password
- At least 1 upper case character must be present in a password
- At least 1 lower case character must be present in a password
- The maximum number of allowed consecutive repeating characters is 3
- The maximum number of allowed monotonic character sequences is 3
- The last 5 passwords will be remembered and cannot be reused
- The default blank password is not permitted
- The password is encrypted with SHA512

- A password will be valid for 90 days
- The user will be prompted of expiring password 14 days in advance
- These rules will be applied to all the new users and password as well as to the existing mlcadmin and mlcengr users
- An example password that fits all the policies: .2wsx3EDC4rfv5TGB

The passwords for the mlcadmin and mlcengr users are set to be expired. Although it is possible to change them on the next login, it is strongly advised to change at this time as from that point root login through ssh is not possible.

| CL-MLC hardening Script     | MLC hardening script has run                                          |
|-----------------------------|-----------------------------------------------------------------------|
| Measures                    | login with root is disabled.<br>Password expiration is set to 90 days |
| Needed Access Rights        | Root                                                                  |
| References                  | Service manual in the Documents folder of the install CD.             |
| Executed                    | Yes: <input type="checkbox"/> No: <input type="checkbox"/>            |
| Customer Comments / Reasons |                                                                       |

## 4.2 MLC Hardening

### 4.2.1 Install SIP certificate on MLC

To be able to use TLS as SIP transport protocol, install MLC certificates for SIP connection according to the Service Manual.

| CL-SIP-CERT                 | Deploy certificates for SIP                                     |
|-----------------------------|-----------------------------------------------------------------|
| Measures                    | Certificates are signed by organisation CA and deployed on MLCs |
| References                  | OpenScape Xpert Service Manual                                  |
| Needed Access Rights        | SM Administrator                                                |
| Executed                    | Yes: <input type="checkbox"/> No: <input type="checkbox"/>      |
| Customer Comments / Reasons |                                                                 |

### 4.2.2 Install CSTA certificate on MLC

When CSTA Line Monitoring is enabled: to be able to use MTLS for CSTA connections, install MLC certificates for CSTA connection according to the Service Manual.

| CL-CSTA-CERT                | Deploy certificates for CSTA                                    |
|-----------------------------|-----------------------------------------------------------------|
| Measures                    | Certificates are signed by organisation CA and deployed on MLCs |
| References                  | OpenScape Xpert Service Manual                                  |
| Needed Access Rights        | SM Administrator                                                |
| Executed                    | Yes: <input type="checkbox"/> No: <input type="checkbox"/>      |
| Customer Comments / Reasons |                                                                 |

# 5 OSX Client Device Hardening

## 5.1 OSX Client Hardening

Each terminal device in OSX shall be hardened.

General requirements for all PCs, which run communication clients and applications:

- The operating system version is released for the communication software (see sales information)
- Current security updates are installed (For Softclient: Windows security updates are installed, For OSX Client devices: the latest compatible OSX Client image is installed).

### 5.1.1 OS Hardening

The supported operating systems are:

- Debian V11 "bullseye" - only in case of OSX Client devices (🐧)
- Windows 10, 64 bit - only in case of Softclients (🏠)

In case of Softclients, the customer is responsible for hardening the computer and its OS.

#### 5.1.1.1 Disable automatic VLAN discovery using LLDP-MED (OSX Client devices)

Automatic VLAN discovery using LLDP-MED feature must be disabled due to missing mandatory authentication.

Follow the Service Manual for configuration details.

|                             |                                                                            |
|-----------------------------|----------------------------------------------------------------------------|
| <b>CL-DISABLE-LLDP-MED</b>  | Disable automatic VLAN discovery using LLDP-MED                            |
| Measures                    | Dynamic VLAN assignment should not happen without mandatory authentication |
| References                  | Service manual                                                             |
| Needed Access Rights        | Diagnosis Tool (+ttinstall)                                                |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/>                 |
| Customer Comments / Reasons |                                                                            |

#### 5.1.1.2 Enable and configure Device Lock (OSX Client devices)

Plugging USB sticks and devices should be disabled as it is described in the Service Manual. Additional allowed devices can be configured.

|                       |                                                                |
|-----------------------|----------------------------------------------------------------|
| <b>CL-DEVICE-LOCK</b> | Enable device lock                                             |
| Measures              | Plugging USB sticks/keyboards/mouse/etc should be unsuccessful |
| References            | Service manual                                                 |

|                             |                                                            |
|-----------------------------|------------------------------------------------------------|
| Needed Access Rights        | Diagnosis Tool (+ttinstall)                                |
| Configured                  | Yes: <input type="checkbox"/> No: <input type="checkbox"/> |
| Customer Comments / Reasons |                                                            |

### 5.1.1.3 Configure Firewall according to customer requirements (OSX Client devices)

Unused services (CTI, TurretAPI, etc.) must be blocked in the firewall. Additional custom rules can also be set to accommodate unique site-specific security requirements.

Follow the Service Manual for configuration details.

|                              |                                                            |
|------------------------------|------------------------------------------------------------|
| <b>CL-CONFIGURE-FIREWALL</b> | Configure firewall                                         |
| Measures                     | Unused services must be blocked in the firewall            |
| References                   | Service manual                                             |
| Needed Access Rights         | root                                                       |
| Configured                   | Yes: <input type="checkbox"/> No: <input type="checkbox"/> |
| Customer Comments / Reasons  |                                                            |

### 5.1.1.4 Secure the BIOS (OSX Client devices)

Set up a BIOS password for both the supervisor and the user according to the password policy of your company.

Limit the User Access Level to [No Access] or [View Only].

Ensure that the correct storage device (CF card for N4, CFAST card for N5, SSD for Intel) is the first boot device.

Disable BBS popup if possible.

|                             |                                                                                                                                                                                                                                        |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>CL-CONFIGURE-BIOS</b>    | Configure BIOS                                                                                                                                                                                                                         |
| Measures                    | You will not be able to access the BIOS without a password.<br>You can edit the BIOS settings only using the Supervisor password.<br>You cannot boot from removable devices.<br>The BBS popup option must not be available at startup. |
